                                                                                                                                                                                                               14. J. Biol. Chem. 228:5196-5205(1983).

15. T. SUBJUL. CHELDINYSALIN.

16. T. SUBJULT. MUSCLE CONTRACTION.

17. SUBJULT. MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBJULTS (MHC), 2 ALKALI LIGHT CHAIN SUBJULTS (MLC).

18. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

19. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

19. CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

19. PPM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

20. MASCELLANBOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (HMM). IT CAN LATER BE SPLIT INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED
SEQUENCE OF 1502-1940 FROM N.A.

Ma D., Nothias F., Boyne L.J., Fischer I.;
"Differential regulation of microtubule-associated protein 1B (MAPIB)
in rat CNS and PNS during development.";
J. Neurosci. Res. 49:319-32(1997)
-!- FUNCTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAPIB may play a role in the cytoskeletal changes that accompany neurite extension. Possibly MAPIB Binds to at least two tubulin subunits in the polymer, and this bridging of subunits might be involved in nucleating microtubule polymerization and in
                                                                                                                                                                                                                               nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development.

-!- DOMAIN: By nerve growth factor.

-!- DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

-!- PTM: LCl is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by processing. It is free to associate with both MAPIA and MAPIB. It interacts with the amino-terminal region
                                                                                                                                                   can associate

PHOSPHORYLATED MAPTE MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES

THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST

TWO TUBBLIN SUBBNITS IN THE POLYMER, AND THIS BRIGGING OF SUBNITS

MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STABILIZING MICROTUBULES.
SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE WITH MAPIA AND MAPIB PROTEINS.
DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKELY, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PTM: LCI is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is free to associate with both MAPIA and MAPIB. It interacts with the amino-terminal region
